# CS631 - Advanced Programming in the UNIX Environment

**Shared Libraries** 

Department of Computer Science Stevens Institute of Technology Jan Schaumann

jschauma@stevens.edu

https://www.cs.stevens.edu/~jschauma/631/

```
#include <openssl/rand.h>
int main(int argc, char **argv) {
        int i; unsigned char data[NUM];
        if (RAND_bytes(data, NUM) == 0)
                err(EXIT_FAILURE, "Unable to generate random data: %s\n",
                                strerror(errno));
        for (i=0; i<NUM; i++)
                printf("%02X", data[i]);
        printf("\n");
        exit(EXIT_SUCCESS);
$ cc -Wall -c rand.c
$ cc -Wall rand.o
rand.o: In function 'main':
rand.c:(.text+0x1c): undefined reference to 'RAND_bytes'
$ cc -Wall rand.o -lcrypto
```

## What is a shared library, anyway?

- contains a set of callable C functions (i.e., implementation of function prototypes defined in .h header files)
- code is position-independent (i.e., code can be executed anywhere in memory)
- shared libraries can be loaded/unloaded at execution time or at will
- libraries may be static or dynamic

# What is a shared library, anyway?

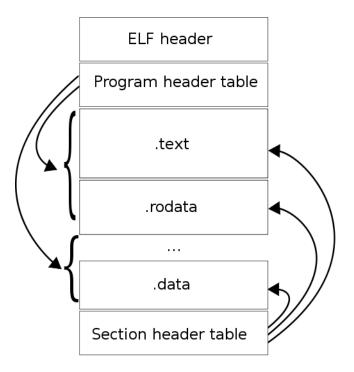

- contains a set of callable C functions (i.e., implementation of function prototypes defined in .h header files)
- code is position-independent (i.e., code can be executed anywhere in memory)
- shared libraries can be loaded/unloaded at execution time or at will
- libraries may be static or dynamic

```
$ man 3 fprintf
$ grep " fprintf" /usr/include/stdio.h
```

#### How do shared libraries work?

- contents of static libraries are pulled into the executable at link time
- contents of *dynamic* libraries are used to resolve symbols at link time, but loaded at execution time by the *dynamic linker*
- contents of *dynamic* libraries may be loaded at any time via explicit calls to the dynamic linking loader interface functions

ELF is a file format for executables, object code, shared libraries etc.

More details: http://www.cs.stevens.edu/~jschauma/631/elf.html http://www.thegeekstuff.com/2012/07/elf-object-file-format/

ELF is a file format for executables, object code, shared libraries

- relocatable file can be linked together with others to produce a shared library or an executable (e.g. foo.o)
- shared object file position independent code; used by the dynamic linker to create a process image (e.g. libfoo.so)
- executable just what it sounds like (e.g. a.out)

```
$ cc -Wall -c main.c
$ hexdump -C main.o | head -2

000000000 7f 45 4c 46 02 01 01 00 00 00 00 00 00 00 00

00000010 01 00 3e 00 01 00 00 00 00 00 00 00 00 00

$ file main.o

main.o: ELF 64-bit LSB relocatable, x86-64, version 1 (SYSV),
not stripped
```

```
$ hexdump -C /lib/libc.so | head -2
00000000 7f 45 4c 46 02 01 01 00 00 00 00 00 00 00 00 00
00000010 03 00 3e 00 01 00 00 00 70 b7 03 00 00 00 00
$ readelf -h /lib/libc.so
ELF Header:
                      7f 45 4c 46 02 01 01 00 00 00 00 00 00 00 00 00
Magic:
Class:
                      ELF64
Data:
                      2's complement, little endian
Version:
                      1 (current)
OS/ABI:
                      UNIX - System V
ABI Version:
                      DYN (Shared object file)
Type:
                      Advanced Micro Devices X86-64
Machine:
Version:
Entry point address: 0x3b770
 . . .
```

```
$ hexdump -C a.out | head -2
00000000 7f 45 4c 46 02 01 01 00 00 00 00 00 00 00 00 00
00000010 02 00 3e 00 01 00 00 e0 07 40 00 00 00 00
$ readelf -h a.out
ELF Header:
                      7f 45 4c 46 02 01 01 00 00 00 00 00 00 00 00 00
Magic:
Class:
                      FI.F64
Data:
                      2's complement, little endian
Version:
                      1 (current)
OS/ABI:
                      UNIX - System V
ABI Version:
                      EXEC (Executable file)
Type:
Machine:
                      Advanced Micro Devices X86-64
Version:
Entry point address: 0x4007e0
 . . .
```

# Understanding object files

```
$ cc -Wall ldtest1.c ldtest2.c main.c
$ nm a.out
                 U _libc_init
00000000004007a0 T _start
                 U atexit
0000000000600ea0 B environ
                 U exit
0000000000400990 T ldtest1
00000000004009b4 T ldtest2
00000000004009d8 T main
                  U printf
$ 1dd a.out
a.out:
        -lgcc_s.1 => /usr/lib/libgcc_s.so.1
        -lc.12 \Rightarrow /usr/lib/libc.so.12
See also: objdump -x a.out
```

#### Static libraries:

- created by ar(1)
- usually end in .a
- contain a symbol table within the archive (see ranlib(1))

```
$ cc -Wall -c ldtest1.c
$ cc -Wall -c ldtest2.c
$ cc -Wall main.c
[...]
$ cc -Wall main.c ldtest1.o ldtest2.o
$
```

```
$ cc -Wall main.c libldtest.a
$ mv libldtest.a /tmp/
$ ./a.out

$ cc -Wall main.c -L/tmp -lldtest -o a.out.dyn
$ cc -static main.o -L/tmp -lldtest -o a.out.static
$ ls -l a.out.*
$ ldd a.out.*
$ nm a.out.dyn | wc -l
$ nm a.out.static | wc -l
```

## Dynamic libraries:

- created by the compiler/linker (i.e. multiple steps)
- usually end in .so
- frequently have multiple levels of symlinks providing backwards compatibility / ABI definitions

```
$ cc -Wall -c -fPIC ldtest1.c ldtest2.c
$ mkdir lib
$ cc -shared -Wl,-soname, libldtest.so.1 -o lib/libldtest.so.1.0 ldtest1.o ldtest2.o
$ ln -s libldtest.so.1.0 lib/libldtest.so.1
$ ln -s libldtest.so.1.0 lib/libldtest.so
$ cc -static -Wall main.o -L./lib -lldtest
ld: cannot find -lldtest
$ mv /tmp/libldtest.a lib
$ cc -static -Wall main.o -L./lib -lldtest
$ ./a.out
[...]
$ cc -Wall main.o -L./lib -lldtest
$ ./a.out
[...]
$ 1dd a.out
[\ldots]
```

#### Wait, what?

```
$ export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:./lib
$ 1dd a.out
[...]
$ ./a.out
[...]
$ mkdir lib2
$ cc -Wall -c -fPIC ldtest1.2.c
$ cc -shared -Wl,-soname, libldtest.so.1 -o lib2/libldtest.so.1.0 ldtest1.2.o ldtest2.
$ ln -s libldtest.so.1.0 lib2/libldtest.so.1
$ ln -s libldtest.so.1.0 lib2/libldtest.so
$ export LD_LIBRARY_PATH=./lib2:$LD_LIBRARY_PATH
$ ldd a.out # note: no recompiling!
[...]
$ ./a.out
[...]
```

## Avoiding LD\_LIBRARY\_PATH:

```
$ cc -Wall main.o -L./lib -lldtest -Wl,-rpath,./lib
$ echo $LD_LIBRARY_PATH
[...]
$ ldd a.out
[...]
$ ./a.out
[...]
$ unset LD_LIBRARY_PATH
$ ldd a.out
[...]
$ ./a.out
[...]
```

#### But:

```
$ export LD_DEBUG=help # glibc>=2.1 only
$ ./a.out
[...]
$ LD_DEBUG=all ./a.out
[...]
```

## Explicit loading of shared libraries:

- dlopen(3) creates a handle for the given library
- dlsym(3) returns the address of the given symbol

```
$ cc -Wall rand.c -lcrypto
$ cc -Wall -rdynamic dlopenex.c
$ ./a.out
```

#### Homework

```
https://www.cs.stevens.edu/~jschauma/631/f17-hw4.html
$ cat hello.c
#include <greet.h>
#include <stdio.h>
int main(void) {
        greet();
        if (setgreeting("Howdy!") != 0) {
                fprintf(stderr, "Unable to set greeting!\n");
        }
        greet();
        hello("you there", getgreeting());
        return 0;
 cc -Wall hello.c -I./libgreet -L./libgreet -Wl,-rpath,./libgreet -lgreet
```
